Ajuste da curva de regressão de $\dot{Q}/\Delta T \times \xi$ - Item 02

APÊNDICE D

Coeficiente de sensibilidade de k em relação à razão experimental $\dot{Q}/\Delta T$

Função $\lambda = \dot{Q}/\Delta T$ das variáveis independentes k e ξ

$$\lambda = \frac{\dot{Q}}{\Delta T} \quad \xi = \frac{k}{\lambda}$$

Ajuste das curvas de regressão dos itens 01 e 02

$$\lambda = a\xi^3 + b\xi^2 + c\xi + d$$

Considerando a função $f(k, \lambda)$ das variáveis independentes k e λ

$$f = a\xi^3 + b\xi^2 + c\xi + d - \lambda$$

Pela regra da cadeia,

$$df = \frac{\partial f}{\partial k} dk + \frac{\partial f}{\partial \lambda} d\lambda$$

Derivada parcial em relação a k , mantendo λ constante

$$\frac{\partial f}{\partial k} = \frac{\partial f}{\partial \xi} \frac{\partial \xi}{\partial k} = (3a\xi^2 + 2b\xi + c)\lambda^{-1}$$

Derivada parcial em relação a λ , mantendo k constante

$$\frac{\partial f}{\partial \lambda} = \frac{\partial (a\xi^3 + b\xi^2 + c\xi + d)}{\partial \xi} \frac{\partial \xi}{\partial \lambda} - 1 = (3a\xi^2 + 2b\xi + c) \left(\frac{-k}{\lambda^2} \right) - 1 = \dots$$

$$\dots = - \left[(3a\xi^2 + 2b\xi + c) \left(\frac{\xi}{\lambda} \right) + 1 \right]$$

Assim,

$$df = (3a\xi^2 + 2b\xi + c) \frac{1}{\lambda} dk - \left[(3a\xi^2 + 2b\xi + c) \left(\frac{\xi}{\lambda} \right) + 1 \right] d\lambda$$

Porém, $f = 0$ e $df = 0$. Assim, substituindo:

$$\frac{dk}{d\lambda} = \xi + \frac{\lambda}{(3a\xi^2 + 2b\xi + c)}$$
